

Trading Journal and Performance Analytics Platform

1. Introduction

The Trading Journal and Performance Analytics Platform is a secure web-based application designed to help traders record, organize, and analyze trading activity across multiple asset classes, market segments, and trading styles. The platform emphasizes structured data entry, time-based performance analytics, and visual insights for informed decision-making.

2. Application Structure and Navigation

The home screen of the application is organized into five primary asset categories with hierarchical subcategories and trading-style-based subsections as described below:

- Equity:
 - Small Cap: Intraday, Swing, Positional
 - Mid Cap: Intraday, Swing, Positional
 - Large Cap: Intraday, Swing, Positional
- Index:
 - Nifty: Intraday, Swing, Positional
 - Bank Nifty: Intraday, Swing, Positional
- Forex:
 - Intraday
 - Swing
 - Scalp
 - Positional

(Includes all forex pairs in a consolidated watchlist)
- Commodity:
 - Intraday
 - Swing
- US Index:
 - Intraday
 - Swing

3. Trade Data Input Requirements

At Trade Entry:

- Instrument name
- Entry price
- Entry date and time
- Stop loss
- Position size

At Trade Exit:

- Exit price
- Exit date and time

4. Performance Metrics and Calculations

- Average win

- Average loss
- Win–loss ratio
- Percentage of winning trades
- Adjusted win–loss ratio adjusted for percentage of winning trades
- Largest win within a selected time frame
- Largest loss within a selected time frame
- Holding duration of winning trades
- Holding duration of losing trades

All metrics and statistics must dynamically update based on user-selected time frames, asset categories, and trading styles.

5. Bell Curve Performance Distribution

- X-axis represents percentage return distribution ranging from –100% to +600%
- Distribution divided into fixed 2% intervals (0–2%, 2–4%, 4–6%, 6–8%, and so on)
- Y-axis represents the number of trades within each percentage interval
- Chart updates dynamically based on filters and time selection

6. Authentication and Data Security

- Password-based user authentication
- Authentication required to access trading data and analytics
- User data privacy enforced through access control
- Protection against unauthorized data access

7. Time Frame Filtering

Users must be able to select custom date and time ranges. All analytics, statistics, and visualizations must strictly reflect data within the selected period.
